At AEG Sports (LA Kings, LA Galaxy, Ontario Reign), I built **Shield**, an internal reporting site.
Built shared AI context and reusable engineering workflows to onboard engineers and their Claude Code/Codex agents.

LA Kings, LA Galaxy, Ontario Reign AEG Sports Feb 2025 – now

Associate Data Engineer intern, then full-time Los Angeles

Own LA Galaxy's data platform, shared commissions across three franchises, and Shield's application and AI integrations. Ran all three teams' pipelines alone after our senior engineer left in May 2026.

- **Shield, full internal reporting site.** Built and maintain the application used across Kings and Galaxy sales and analytics teams for ticket sales, revenue pacing and fan reporting. Added sales Q&A through three Databricks Genie spaces, using the reports' metric definitions and clarifying ambiguous questions before querying. Integrated Entra ID sign-in, Databricks APIs and managed-identity access in Next.js. Demo
- **Reliable AI answers.** Built a test suite of real sales questions, checked generated SQL and results against independent report queries, and tested ambiguous questions and unavailable periods. Fixed failures until all 30 acceptance questions passed; deployed the reporting and Q&A together through staging with a rollback path.
- **AI-assisted engineering standards.** Turned rules like "development jobs must not write to production tables" into reusable instructions and checks for Claude Code and Codex. Covered source-to-report validation, restricted SQL access, regression checks and code review before release. Used agents for implementation and independent review across warehouse, API and frontend changes, with Jira and Confluence access via MCP.
- **Documentation and agent onboarding.** Documented report sources, metric definitions and pipeline troubleshooting. Analysts use it to find source tables and reuse reporting logic. Shared it with Claude Code and Codex; onboarded a new hire's Codex agent with the team's engineering and review rules.
- **Shared data pipelines.** Migrated commissions from Synapse to Databricks for sales and finance across three franchises, covering 2M+ reporting rows. Built LA Galaxy's daily customer and ticket feeds into Salesforce Marketing Cloud, serving 600K+ customer records for marketing; retired legacy processing that cost $31K a year.

Applied AI and Sports Analytics 2021 – now

Stats Perform data engineering intern Summer 2023

- Built Opta Smash, an AI tennis radio prototype that turned Opta point feeds into GPT-4 commentary and AWS Polly audio. Developed structured prompts with adjustable commentary depth and narrator personas, demonstrated the system in Streamlit on Australian Open footage, and manually reviewed hallucinations. Also worked with live betting feeds. Demo

USTA Player Development data analyst, tournament work 2023 – 2024

- Match prep for Coco Gauff, Ben Shelton and other US players using Hawk-Eye tracking. Demo

Team USA Cycling data analyst, project-based 2024 – 2025

- Tagged video frames at VELO Sports Center to collect splits for infield-TV feedback between efforts. Built Tableau dashboards coaches used to select sprint riders and plan training. Demo

Bruin Tennis Consulting founder, student-run analytics program 2021 – 2025

- Turned one shared Dartfish account and no funding into a student-run analytics program for UCLA men's tennis. Recruited and trained about 80 students; built a tagging site, video pipeline and D3 dashboards for match review and serve/return patterns. UCLA reached the 2025 NCAA quarterfinals. Demo

Forward-deployed AI, data and web work for LA brands Jul 2026 – now

- **Toroline** tennis strings. Built a market-intelligence site combining 3 retailer feeds, lab tests and creator data; packaged a reusable Claude workflow for price and availability review. Demo
- **MARKET** (Chinatown Market), a streetwear brand that reached $30M in sales. Chose Claude Artifacts over a separate app for product-sales and stock review, so an analyst on its 5-person team can update the workflow himself; the public demo uses sample data. Demo
- **Giant Robot** art gallery. Identified a roughly 350-artwork listing bottleneck; built a Shopify draft tool that turns artist spreadsheets into listing drafts with photo matching and flags for missing details and shipping review.

AI and integrations Claude Code, Codex, MCP, Databricks Genie, LLM APIs, prompting, tool use, answer evaluation, REST APIs, webhooks, Jira, Confluence
Engineering Python, TypeScript, SQL, Next.js, Databricks, Spark, Azure (App Service, Functions, Entra ID, managed identity), AWS Polly, CI/CD, automated tests, code review, staged deployment
Education UCLA, B.S. Data Theory, 2025 **Languages** English, Mandarin
